

Technical Test - Body Check Dashboard

Assignment

Build a **Body Check Dashboard** that displays the latest health measurements for a patient, based on data from a FHIR observations API.

What to Build

<https://www.figma.com/design/ZyOCqpW0RzZWA8kJQ6Lq6A/Technical-test---Body-Check-Dashboard?node-id=1-2&t=HyrZPgTV2bJnyAJX-1>

Dashboard Overview Cards (top section)

Display the **most recent value** for each of the following measurements in individual cards:

Card	Source	Notes
Body Length	API	In cm
Body Weight	API	In kg
BMI	Calculated	<code>weight (kg) / (height (m))²</code>
Blood Saturation	API	In %
Blood Pressure	API	In mmHg
Heart Rate (rest)	API	In /min

BMI is not returned by the API — it must be calculated from the latest Body Weight and Body Length values.

Measurements List (below the cards)

Display **all observations** in a paginated list. Each list item should show:

- Observation type
- Value + unit
- Date/time of measurement

The list should support **pagination** using the API's built-in pagination parameters.

Note: The endpoint returns items in random order — make sure to handle sorting appropriately.

The API

Base URL:

```
1 https://body-check-dashboard.vercel.app/api/observations
```

This endpoint returns a paginated list of **FHIR Observations** covering the **last 10 years**.

Query Parameters

Parameter	Type	Description
<code>page</code>	number	Page number (for pagination)

pageSize	number	Number of items per page
count	number	Total count of items to return
sort	string	Sort order for results

Observation Types Returned

Observation	Unit
Body Length	cm
Body Weight	kg
Blood Pressure	mmHg
Blood Oxygen Saturation	%
Heart Rate (rest)	/min

Example FHIR Observation Response Shape

```
1  {
2    "resourceType": "Bundle",
3    "total": 800,
4    "entry": [
5      {
6        "resource": {
7          "resourceType": "Observation",
8          "code": {
9            "coding": [
10             {
11               "system": "http://loinc.org",
12               "code": "8302-2",
13               "display": "Body height"
14             }
15           ]
16         },
17         "valueQuantity": {
18           "value": 182,
19           "unit": "cm"
20         },

```

```
21         "effectiveDateTime": "2024-03-15T09:30:00Z"
22     }
23 }
24 ]
25 }
26
```

Technical Requirements

- Fetch data from the FHIR observations endpoint
- Parse and display the **latest** value per observation type in the top cards
- Calculate **BMI** from the latest weight and height values
- Display **all observations** in a paginated list below the cards
- Handle the fact that items are returned in **random order**

Preferred libraries

- React
- React Query
- Shadcn
- Tailwind
- (FHIR types library)

Bonus Points

- **Loading state** — show a skeleton or spinner while data is being fetched
- **Responsive design** — the dashboard should work well on both desktop and mobile
